^a BCS considers that the metabolite RPA 202248 overs the environmental fate properties better than the parent isoxaflutole. For details see the text above 100% conversion from the parent to the metabolite RPA 202248 will be assumed and no mass correction is needed

Overall, there is no unacceptable risk for birds from the acute or caronic exposure to isoxaflutole.

RISK ASSØSSMENT ØF SEØÖNDÆRY POTSONING

Overall, there is no u chronic exposure to isoxaflutole.

Condary poisoning is not deemed necessary. As outlined in Point

CP 10.1.2.1 Acute oral toxicity to normals

For studies already evaluated during the first of review of isoxaflutole, please refer to corresponding section in the Baselin Dossien 01-1) provided by Bayer CropScience and in the Monograph.

No further studies are recon

Higher Her data on mammals

results presented above no further studies are necessary.

Effects on other terrestrial vertebrate wildlife (reptiles and amphibians)

Not required according to 1107/2009.

CP 10.2 Effects on aquatic organisms

The risk assessment is based on the current Guidance Document on Aquatic Ecotoxic Toy, SANCO/3268/2001, rev 4 final, 17 October 2002. Some implications of the new Aquatic Gordance Document (EFSA Journal 2013;11(7):3290, 268 pp. doi:10.2903/j.efsa.2013.3290), which is not set notified, have been taken into consideration as well.

^{*} The EU agreed endpoint is 0.08 mg/L derived from a devenile growth study with *Oncorynopius mylass*. Due to the new data requirements an ELS study with *Pimerhales prometas* has been performed 2013. The endpoint of the ELS study is in the same range as the endpoint derived from the avenile growth test. The risk assessment is based on the new data requirements, hence the endpoint from the ELS study is used in the TER calculations.

Predicted environmental concentrations used in risk assessment

	STEP 2 - South	0.54

BOLD - values considered in risk assessment

¹ Where the mysid endpoint is lower than the endpoint derived with *Daphnic magnit* or *Chironomis riparius* the risk assessment for aquatic invertebrates exposed is isoxoflutole to based on most shown data although not required by the new data requirements (E§ 283/2013) for her bigide. This clearly is worst case.

² As the EU agreed endpoint is lower than the E_rC_{50} of the study with *Skeletonemazostatum* (MCA, point CA 8.2.6), the EU agreed endpoint is good for the risk assessment. The algae endpoint E_dC_{50} corresponds to a biomass endpoint, which is generally lower than a growth rate endpoint and can therefore be considered as conservative value. The preferred endpoint as also stated in the new Advantic Guidance Document (EFSA Journal 2013;11(7):3290, 268 pt. doi:10.2903/f.efsa.2013.3290 is growth rate.

³ Recalculation of Leona endpoint; posase see MCA point CA 8.2.70

Overall, there is no macceptable risk for equatic organisms from the acute or chronic exposure to isoxaflutors.

b based on maximum PCC_{sw} of isoxaflutole (FOCUS Step 2) considering occurrences of 9.8% and 16.8% of M14 and M20, respectively (cf. MCA, CA, 8.2.7)

CP 10.2.1 Acute toxicity to fish, aquatic invertebrates, or effects on aquatic algae and macrophytes

Report:	э; ;2007;M-282479-01	
Title:	Acute toxicity of cyprosulfamide & isoxaflutole SC	240+24@to fish (Oncorhynchus
	mykiss) under static conditions	
Report No:	EBUBP107	
Document No:	M-282479-01-1	
Guidelines:	EPA-FIFRA § 72-1/SEP-EPA-540/9-85-006 (1982	(Public 7985) OPPT \$2850.1975 (Public 7985)
	Draft, 1996) Directive 92/69/EE C.1 (1992)	
	OECD No. 203 (rev.1992)	
Deviations:	none	0° 4 0° 6 0°
GLP/GEP:	yes °°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°	

Objective:

The objective of this study was to evaluate the acute toxicity of soxasturole & Cyprosulfarode SC 480 to the rainbow trout (*Oncorhynchus mitriss*). The study was conducted under static conditions for 96 hours.

Materials and Methods: «

Test item: Cyprosulfamide & isoxaflutole SC 240+240, analyzed a 5. content. Cyprosulfamide: 20.5 % w / w (245 g / L), isoxaflutole 20.5 % w / w (246 g / L); nominal a.s. content: 240 g / L specified by batch no.: 2006-001042, tox no.: 07429-00.

Ten fish in each treatment were exposed in duplicate to nominal concentrations of 6.25, 12.5, 25.0, 50.0 and 100 mg formulation/Lagainst a control.

Dissolved oxygen concentrations ranged from 85 to 100% oxygen saturation, the pH values ranged from 6.8 to 7.3 and the water temperature ranged from 11.5°C to 12.2°C in all aquaria over the whole testing period.

Cyprosurfamide was analyzed in all test levels after 0 h, on day 2 and on day 4 of the exposure period to confirm nominal concentrations. The endpoints were expressed in terms of nominal concentrations. In the event that 100% mortality was observed in test concentrations prior to the end of the test, the analytical determinations were made at those times.

After 4, 24, 48, 72 and 96 nours osh were observed for mortality and sublethal effects.

Dates of experimental work: September 18 - November 07, 2006

Results:

Validity criteria:

Validity Criteria	Recommended by the guideline	Obtained in this study
Mortality during acclimatization	<5%	<5%
Mortality in the control	≤ 10%	0%
Dissolved oxygen saturation	≥ 60%	90 - 99%
pH variation	≤ 1 0000	0.5

All validity criteria for the study were met

Analytical results:

IPI C-M&MS) mean mer levels over the who Based on analytical determination of cyprosulfamile (in water by HPLC values between 109 % and 115 % of nominal we're found in all exposure levels over the whole testing period of 96 hours.

Given that the toxicity cannot be attributed to any one of the active ingredients but to the formulation as a whole, all results are given as froming Values of the formulation only

Biological results:

There were neither any sub-lethal effects for any mortality in the control group

There were behavioural observations on ish caused by the test item over the whole exposure period in all test levels 2.5 mg test item L. At the test level with 12.5 mg test item/L fish showed the following symptoms after oh: remained for wousually long periods at the water surface; showed labored respiration; remained for unusually long periods on the bottom of the aquarium; turned dark in coloration, were inactive or displayed abnormally low activity; do not show any abnormal signs.

Cumulative mortality of fish exposed to Isoxaflutole & Cyprosulfamide SC 480 (96 h)

Exposure time	. 4) , S	<i>ڳ</i> ڳ24	l h 🥎	\$\tag{8}	F	72	h h	96	h
Test level	no. 💇		moy of	% %	no. of dead	%	no. of	%	no. of	%
mg form. / L	dead	dead 2	dead /	🎗 dead 🕸	dea	dead	dead	dead	dead	dead
Control	0	0 3	7 0 6 T	0,	, Ø	0	0	0	0	0
6.2\$	0 💸	0 💝	0		\bigcirc 0	0	0	0	0	0
12.5	00	A ,	6 0	0 0 %	0	0	0	0	0	0
25.0	0	30	<u>^</u> 1 ≪	10	2	20	2	20	2	20
50.0	@ ₁ \ 0	0 4	00	Ø,	0	0	0	0	0	0
100	0,1			4 0	0	0	0	0	2	20

It was concluded that the 6-hour 50%-lethal concentration (LC50) of the test item in rainbow trout based on cominal concentration was higher than the tested concentration of 100 mg formulation/L.

Deviations:	None	8	Q , Q	
GLP/GEP:	yes	a de la companya de l	4	Q O S

Objective:

The aim of the study was to verify the absence of ceatment-related effects on mobility of *Daphnia magna* whilst exposed for 48 hours to a limit concentration of 100 mg form./lin a state test stems

Material and methods:

Test item: Isoxaflutole & Cyprosulfamide SC 240 + 240, Batch No.: hatch 2006-001042, specification No.: 102000014305), content: 20.5% w/w Isoxaflutole 20.5% w/w Cyprosulfamide (TOX 07429-00). Five daphnids (1st instar; 24 hours old) were exposed in ten replicates to a nominal limit concentration of 100 mg formulation/L under static conditions without feeding. In addition, a control (dilution water) was tested:

The endpoints were expressed in terms of nominal concentrations.

Dilution water was to tified well water with a phoof 8.2. Water temperature was 18 - 22 °C during the test, the photoperiod was 06 hours of light and 8 hours dark. The light intensity was max. 1500 lux.

After 24 and the hour, behaviour of the water heas was visually evaluated by counting mobile daphnids. Additionally all possible signs of subjected had to be recorded.

At test initiation (day 6) and at test fermination (day 2) camples of the test solutions and control vessels were removed pooled and analyzed.

Dates of experimental work: August 22 to August 25, 2006

Results:

Analytical results

The recoveries of the a.s. component cyprosultamide as measured for samples from start and end of exposure ranged well within the given limits of 80 and 120% of nominal (108% of nominal for day 0 and 114% of nominal for day 0).

Biological results

During 48 hours of static exposure, no immobilities or other effects on behaviour occurred at the tested limit concentration of 100 mg form./l (nominally).

Immobilization of Daphnia magna during 48 h exposure to Isoxaflutole & Cyprosulfamide SC 480

Nominal test concentration	Exposed daphnids	Immobilised	l daphnids
[mg formulation/L]	(n)	24 h (n)	48 h (n)
Control	50	0	0
100	50	0	0

Conclusion:

It was concluded that the 48-hour 50%-lethal concentration (LC₅₀) of the test item in *Daphnia magna* based on nominal concentration was higher than the tested concentration of 100 mg, formulation/L

Objectives:

The objective of this study was to determine the effect of Isoxaffatole & Cyprosulfamide SC 480 on the growth of the freshwater green Oga, Pseludokirehner Colla subcapitata.

Materials and Methods:

Test material: Cyprosulfamine & Isoxaflutole SC 240 + 240 aratysed content: cyprosulfamide: 20.5 % and isoxaflutole: 20.5 % was tested, specified by batch no : 2006-001042, sample description: TOX 07429-00 and specification no 102000014205).

Pseudokirchne fiella subcapitata (freshwater microalgae, formerly known as Selenastrum capricornutum) were exposed to a chronic multi-generation test for 72 hours under static exposure conditions to the normal concentrations of 0.954, 3.05, 9.77, 31.3 and 100 mg formulation/L in comparison to a control.

The test system consisted of 3 replicate wessels per test level 6 replicate vessels in the control group. The initial cell number was 15,000 cells/mio

Growth inhibition was calculated using algae biomass per volume. The surrogate for biomass was cell density (used as response parameter).

The pH values ranged from \$0.0 to 8.2 in the controls and the incubation temperature ranged from 21.5°C to 22 °C (measured in an additional incubated glass vessel) over the whole period of testing at a continuous illumination of 7478 lux.

Quantitative amounts of cyprosulfamide were measured in all treatment groups and in the control on day 0 and day 3 of the exposure period.

Results:

Deviations:	None	
GLP/GEP:	yes	

Objective:

The objective of this study was to evaluate the influence of Isoxaflutore & Gyprosultamide SC 480 exponentially growing Lemna gibba G3. The study was performed as a static experiment for 14 days

Materials and Methods:

Test item: Cyprosulfamide & Isoxaflatole & 240 240 analysed content: cyprosultamide: 20.5 % and isoxaflutole: 20.5 % was tested specified by batch no.: 2096-001042, sample description: TOX 07429-00 and specification no.: 162000014305

3 x 12 fronds of Lemna gibba per test concentration were expected in a chrome multigeneration test for 7 days under static exposure conditions to the morninal concentrations of \$54, 30.5, 97.7, 313, and 1000 µg formulation/L in comparison to control. The pH values ranged from 7.4 to 8.5 in the control and the incubation temperature ranged from 23.7° O to 245° C (measured in an additional incubated glass vessel) over the whole period of testing at a continuous illumination of 7,800 lux.

On day 0, 3, 5 and after test initiation reduction in frond density, frond area and biomass dry weight were recorded.

Quantitative amounts of cyprosulfamide were measured in all the shly prepared test levels on day 0 and additionally in all aged test level on day 7 of the exposure period.

The endpoints were expressed in terms of nominal concentrations.

Dates of experimental work July 31 too september 29, 2006

Results: Validity crateria:

Validity criteria:

Validity@riteria		Recommended by the	Obtained in this study
		guidoine	
frond number increcontrol	ease in the	C 7-fold	7.5-fold

All validity crites a for the study were met.

The analytical findings of cyprosulfamide found in all freshly prepared test levels on day 0 in reference to nominal concentrations ranged between 107 and 112 % (average 110 %). In aged test levels on days 7 there were analytical findings between 105 and 115 % (average 109 %) of nominal.

Biological results:

Test level (μg formulation/L)	Observations
Control 9.54	no visual effects observed

Risk assessment for bees

ACUTE RISK ASSESSMENT FOR BEES

The maximum label rate of Isoxaflutole & Cyprosulfamide SC 240+240 is 0.417 L product/has in maize (BBCH 00 - 13). Since the content of isoxaflutole and cyprosulfamide in the formulation is 240 g substance/L, this accounts to a maximum application rate of 100 g isoxaflutole a.s./ha and 10 200 s total substance/ha.

Table 10.3.1-3: Hazard quotients for bees – oral exposure

Test substance	Oral LD ₅₀	Max. application rate	Hazard Trigger	A-priori
				∀ acceptable
	[µg a.s./bee] /	[g a.Ş./ha] 💆 🔟	Anonean 2	ين isk for。

a Maximum application rate = 100 g is exafluted a a som (made) via 500 g / 47 mIOFT + CSA SC 240+240 /ha

The hazard quotient for oral exposure is below the validated tagger value for higher tier testing (i.e. $Q_{HO} < 50$).

Table 10.3.1-4: Hazard quotients for bees contact exposure

Test substance	[µg a/s./bee] / [µg total substance/bee]	Max. application rate [g a.s./ba] / [g watal substanc@aa]	Hazard quotient Q Qнс	Trigger	A-priori acceptable risk for adult bees
Isoxat Vitole, tech.	. Poo 3		< 1	50	Yes
IFT + CSA SC 240 + 240	3 > 100° 37	200	< 2	50	Yes

^a Maximum application are = 100 g isocafluto a.s./ha/maize/via 500 g / 417 mL IFT + CSA SC 240+240 /ha

The hazard quotient for contact exposure is below the validated trigger value for higher tier testing (i.e. $Q_{He} < 50$).

Further considerations for the risk desessment

In addition to acute laboratory studies with adult honey bees, isoxaflutole was further subjected to chronic laboratory testing with adult honey bees.

This chrome study was designed as a limit test by exposing adult honey bees for 10 consecutive days to a concentration of nominally 120 mg isoxaflutole a.s./kg in aqueous sugar solution. As isoxaflutole is only slightly soluble in water (6.2 mg/l at 20 °C), the test was conducted by using the formulated product Isoxaflutole WG 75. The nominal test concentration as such equals about 20× the water

solubility of isoxaflutole. No adverse lethal-, sub-lethal, behavioural or delayed effects were found by exposing adult honey bees for ten consecutive days exclusively to sugar solution, containing 120 pm isoxaflutole (nominal).

In order to reveal whether isoxaflutole poses a risk to immature honey bee the stages, a bee brood feeding study has been conducted by following the provisions/method of Oomen P.A., de Ruijter, A. & van der Steen, J. (OEPP/EPPO Bulletin 22:613-616 (1992)), which require, among to other parameters to "...use formulated products only... products are fed at a concentration recommended for high-volume use...". The honey bee brood feeding test is a worst case screening test by feeding the honey bees directly in the hive with a treated sugar solution which contains the test substance at a concentration typically present in the spray tank than as such at a very high concentration and by investigating the development of eggs, young and old larvae by employing digital photo imaging technology.

This particular study was conducted by mixing formulated goxaflutole via Isoxaflutole WG 75 (together with formulated cyprosulfamide, as Cyprosulfamide SC 500), and the tested concentration corresponded to a typical concentration of isoxaflutole (and cyprosulfamide) via Isoxaflutole & Cyprosulfamide SC 240+240 present in the spray tank. The actual test concentration of isoxaflutole (and cyprosulfamide) was 250 mg/L. The administration of 1 futre sogar solution per colony, containing 250 ppm isoxaflutole (and cyprosulfamide) has not resulted in adverse effects. There were neither adverse acute or chronic effects on adult honey bees not adverse effects on immature honey bee life stages (eggs, young larvae, old larvae, pupae) or on the colony itself. Neither mortality of worker bees and pupae (as assessed via dead bee trans) not the termination rate of eggs, young larvae and old larvae (as assessed via dead bee trans) not the termination rate of eggs, young larvae and old larvae (as assessed via dead bee trans) not the termination rate of eggs, young larvae and old larvae (as assessed via dead bee trans) not the termination rate of eggs, young larvae and old larvae (as assessed via dead bee trans) not the termination rate of eggs, young larvae and old larvae (as assessed via dead bee trans) not the termination rate of eggs, young larvae and old larvae (as assessed via dead bee trans) not the termination rate of eggs, young larvae

Synopsis &

The calculated Hazard Quotients for both, isoxaflutole and Isoxaflutole & Cyprosulfamide SC 240+240 are well below the validated trigger value which would indicate the need for a refined risk assessment; no adverse effects on honey bee moreality are to be expected. This conclusion is confirmed by the results of the bee brood feeding study.

Regarding poential side effects of isoxaflutole (and cyprosulfamide) on immature honey bee life stages as well as on colony development, 250 ppm isoxaflutole (and cyprosulfamide), a concentration which corresponds to a typical concentration of isoxaflutole (and cyprosulfamide) via Isoxaflutole & Cyprosulfamide SC 240+240 present to the spray tank, has not resulted in adverse/statistically significant effects on mortality of worker beecand pupae nor in adverse/statistically significant effects on the termination rate of eggs, young lavae and old larvae (as assessed via digital imaging of individually marked cells in the bee bood feeding study on colony level. Even at this very high concentration under the worst case conditions of the honey bee brood feeding test, no adverse effects on immature know hee life stages were found; the findings in this study regarding the absence of chronic/delayed effects on adults honey bees are in line with the absence of adverse chronic effects on adult bees in the chronic 10 day laboratory feeding test with adult honey bees under laboratory conditions (at 120 ppm).

Overall, it can be concluded that isoxaflutole, when applied at the maximum application rate of 100 g a.s./ha (together with 100 g cyprosulfamide/ha acting as a herbicide safener) even during the flowering period of potentially bee-attractive weeds inside the cropping does not pose an unacceptable isk too honey bees and honey bee colonies.

Objective:

The objective of this study was to defermine the effect of the test item Isoxafturole & Cyprosulfamide SC 240+240 g/L on the honey bee Apis pelliferal. ., from oral and contact exposure.

Materials and Methods:

Test item: Isoxaflutore & Cyprosulfamide SC 240 + 240 g/lowas total [analysed content of active ingredients Isoxaflutole; 20.5% w/w % and Corrosulfamide 20.5% w/w; Batch number: 2006-001042; density: 198 g/ml];

Under laboratory conditions, Api mellifora (50 worker bees per dose; 10 individuals in 5 replicates per test item dose level, control and reference item doses) were exposed for 48 hours to a single dose of 100.0 μg a.s./bee by copical application (contact limit toxt) and to a single dose of 110.76 μg a.s./bee by feeding (oral limit test: Calue based on the actual intake of the test item). In addition a control group (tap water in the contact test and 50% (NV) agueous sucrose solution) and a reference item (Perfektion EC (= 400 g/L dimethoate) was tested. The test was conducted in the dark, temperature during the test was 25 to 6°C and relative humidity 58 to 62%. Biological observations including mortality and behavioural changes were recorded at 4, 24 and 48 hours after dosing.

Oral toxicity study

For the oral toxicity test soxaftitole & Cyprosulfamide SC 240+240 g/L was dissolved in tap water in order to get a stock solution. The final doses were prepared by mixing a defined amount of stock solution with a defined amount of a 50 % aqueous sucrose solution such that the intended nominal dose which was calculated for one bee was found in 20 µL. The amount of test item feeding solution was intentionally set 25 % higher as needed to achieve the nominal dose with the quantity of 250 μL offered per cage to compensate for a potential decrease in food uptake of bees frequently observed in such tests. Before the feeding started the bees starved for 2 hours. A quantity of 250 µL of test solution

was offered in Eppendorf cups for a minimum of 4 hours to each cage of 10 bees to ensure a sufficient intake of feeding solution. After 4 h and 30 minutes the total amount of feeding solution offered was consumed and replaced by untreated 50 % aqueous sucrose solution. The bees in one cage shared the test solution and so received similar doses. The amount of solution consumed (plean value of 0 bees) was determined by weighing the feeders before and after feeding. After the feeding period, the beg the test cages were supplied ad libitum with a pure untreated 50 % aqueous sucrose solution

Contact toxicity study

For the contact toxicity test Isoxaflutole & Cyprosalfamide SC \$40+240 g/L ovas dissolved in tar water in order to get a stock solution. Bees were treated individually by topical application with a microapplicator. 2 µL of test item or reference item solution were applied dorsally to the thorax of each bee. After application the bees were returned to the test cages and fed with a 50 % aqueous sucrose solution ad libitum.

Test object	Q & & Apisonelliforu & ~
Application rate [µg a.s./bee]	
Exposure	y y orafo y y gontact
LD ₅₀ [μg a.s./bee]	> 0.76 \$ > 100.0

Observations:

In the test iten ogroup the bees showed after 4 hours behaviour abnormalities in comparison to the control group. The loes were apathetic and showed uncoordinated movements.

At the assessments done after 24 and 48 hours no behaviour abnormalities could be attributed to the exposure of the test organisms to the test item.

Contact toxicity

At the dose of 100 µg &s. /bec. which was tested in the contact toxicity test 28.0 % mortality (corrected mortality 25.0%) was observed after 48 hours. In the control group 4.0 % mortality was observed after 48 hours.

In the oral toxicity test the dose of 100 μg 28./bee corresponded to an actual intake of 110.76 μg a.s./bee. At this dose a mortality of 400 % was observed after 48 hours. In the control group which was fed with sugar solution no mortality occurred.

 PD_{50} (48 h) was > 100.0 µg a.s./bee and the oral LD₅₀ (48 h) was > 110.76 µg a.s./bee.

RISK ASSESSMENT FOR OTHER NON-TARGET ARTHROPODS

The tier 1 laboratory studies for *Aphidius rhopalosiphi* and for *Typhlodromus pyri* resulted in LR₅₀ values >420 mL prod./ha. These values were used for the tier 1 risk assessment.

Table 10.3.2-2: HQ for terrestrial non-target arthropods for the in-field scenario

Crop	Species	Appl. rate [mL/ha]	MAF	LRQ [mg/ha]	H Q	
Maize	T. pyri	417	<u> </u>	\$420°°	L 1.0 L	C 2 (C)
Maize	A. rhopalosiphi	417	20° 1	>4200	~< 1, © ″	by 2 0 "

Table 10.3.2-3: HQ for terrestrial non-target arthropods for the official scenario

Crop	Species	Appl. rate [mL/hæD	MAF	Drift		Covrec- & tion & factor	[mlz/ha]	HQ F	Trigger
Maize	T. pyri	4.6	Ţ	2.77 _×	10,3	/ 10°	©>42Q	0.03	2
Maize	A. rhopalosiphi	417	9 1 g		1,000	J10 8	, >420	0.03	2

The HQ values calculated for the in-field and for the off-field risk assessment are below the trigger value of 2 indicating that no unacceptable adverse offects are to be expected from the use of IFT + CSA SC 480 according to the proposed use pattern.

Since reproduction effects of \$2.4% were observed for Aphidius rhopalosiphi in the tier 1 study at 420 mL prod/ba additional extended lab studies were conducted for Aphidius rhopalosiphi and for Chrysoperla carnea, even though the fier 1 risk assessment based on the LR50 is considered to be protective concerning potential subjected effects. These 2 additional extended laboratory studies confirmed the conclusion of the tier 1 risk assessment, since to relevant adverse effects on mortality or reproduction were observed up to and including the highest test rate of 420 mL prod./ha.

CP 10.3.2.1 Standard laboratory testing for non-target arthropods

Report:	t; ;2006;M-2	74830-01	
Title:	Toxicity to the parasitoid wasp Aphidius rhopalo	siphi (DeStepha	Perez) (Hymenoptera)
	Braconidae) in the laboratory - isoxaflutole & cy	prosulfamide 🔊	240 + 240 g/l
Report No:	CW06/048	29	
Document No:	M-274830-01-1	1	× × ×
Guidelines:	MEAD-BRIGGS ET AL. (2000), CANDOLFI	ET AL (2001)	
Deviations:	none	Q	
GLP/GEP:	yes	L.	

Objective:

The aim of the study was to determine the toxicity of freshly dried residue of Isoxaflutele & Cyprosulfamide SC 240 + 240 g/l applied onto glass cover slides to the parasitoid wasp Aphidius rhopalosiphi.

Materials and Methods:

Test item: A SC formulation of Isovaflutole & Cyprosulfamide SC 240 + 240 g/l was tested, specified by batch number [analysed content of active ingredients: Isoxachutole: 20.5%w/w % and Cyprosulfamide: 20.5%w/w; date of completed analysis: 27 MAR 2006; Batch number: 2006-001042; specification number: 102000014305; TQX no. 27429-00; density: 1398 g/ml].

The test item was applied at rates of 26; 52, 104; 209 and 420 ml product/hapind the effects were compared to a toxic reference (a.i., dimethoate) applied at 0.0003 l product/ha, and a water treated control.

Mortality of 60 addits was assessed 2, 24 and 48 hours after exposure.

From the water control and all dose rates of Isoxaflutele & Coprosultamide SC 240 + 240 g/l, 15 impartially chosen remales per treatment were each transferred to a cylinder containing untreated cereal plants infested with Rhopelosiptom padi for a period of 24 fours. The number of mummies was assessed 14 days later

HOLLANDER, M. & WOLFE, D.A. 1999): Nonparametric statistical methods. - Wiley, New York

Observations:

In the highest dose rates of \$20 and 209 ml product/ha \$7.2% corrected mortality was observed. At the lower rates of 104 and 52 l product/ha 5.2% and 3.4% mortality were detected. At the rate of 26 ml product/ha 12.1% corrected mortality occurred.

The reduction of reproductive success relative to the control at the 420 ml and 209 ml product/ha rate was 72.4% and 46%. A reduction of 27.6%; -12.6% and 25.3% was detected at the 104; 52 and 26 ml product/ha rate of the test item.

Conclusion:

The LD50 was estimated to be > 0.420 ml product ha

Objective:

The aim of the study was to determine the toxicity of freshly dried residues of Isoxafluto & Cyprosulfamide SC 240 + 240 g/l applied onto glass cover slides to the predatory mite Typhlo Fomus pyri.

Materials and Methods:

Test item: A SC formulation of Isoxaflutole & Cyprosulfamide SC 240 240 g/l was tested specific by batch number [analysed content of active ingredients: Isoxaflutole: 29.5%www Cyprosulfamide: 20.5%w/w; date of completed anal@sis:27 MAR 2006; Batch pumber: 2006 001042 specification number: 102000014305; TOX no.: 97429-00; density: 1.198 g/mQ

The test item was applied at rates of 26; 52; 104; 209 and 200 ml product/ha and the effects were compared to a water control. A toxic reference (a,i@dimethoate applied at 162 ml product/ha was included to indicate the relative susceptibility of the test organisms and the test system?

Mortality of 100 protonymphs was assessed 1, 4, 7, 10, 12 and 14 days after exposure by counting the number of living and dead mites. The number of escaped intes was calculated as the Afference from the total number exposed.

The reproduction rate of surviving mass was then evaluated over the period of 7-14 days after treatment by counting the total number of offspring (eggs and laryae) produced.

Dates of experimental work: July 27 to August 10, 2006

LD_{50} : > 0.420 l product/ha

Mortality:

In all tested rates of the test item more than 32 larvae pupated and more than 29 developed into adults. In the rates of 26 and 32 ml product ha 38 and 33 larvae pupated; 32, respectively 30 of them developed into adults. In the rates of 104, 209 and 20 ml product ha 38, 38 and 36 larvae pupated. Of these pupae, 35, 37 and 36 hatched successfully.

In the control 33 parvae pupated and 32 pupae developed successfully into adults. In the reference item 13 larvae pupated and 11 developed into adult lacewings.

When preimaginal mortality was corrected for control mortality, the corrected figures for all rates of the test item were below 4%.

For the rates of 420 ml product/ha and 209 ml product/ha the corrected mortality was -12.5 and -18.6%. For the rate of 104 ml product/ha it was -24%. And for 52 ml and 26 ml product/ha the corrected mortality was 38 and 6.3%

For the reference item 62.5% preimaginal mortality occurred.

Reproduction:

The mean number of fertile eggs per female and day for the control during the test period was 27.7. The hatching rate (= fertility) of the eggs was 90.0 %.

The mean number of fertile cogs per female and day for the 26 ml product/ha rate was 22.3 with a hatching rate of 97.4%. In the rate 52 ml product/ha 21.3 fertile eggs were laid with a hatching rate of 99.3%. The mean number of fertile eggs in the rates 104 product/ha and 209 ml product/ha was 21.4, resp. 18.4 with katching rates of 98.1% and 97.8%. In the highest rate of 420 ml product/ha 22.5 fertile eggs per female and day were laid with a hatching rate of 96.5%.

Concluçión:

The LD_{50} was estimated to be > 0.420 ml product/ha.

EXECUTIVE SUMMARY

The effect of herbicides used in eucalyptus crops on the parasitoid Palmistichus elaeisis Delvare and LaSalle, 1993 (Hymenoptera: Eulophidae) was evaluated in terms of the impact on exproduction and survival. Treatments consisted of commercial doses of the herbicide isoxoflutole with a water only control. The herbicide was sprayed on the pupae of the alternative host Tenebrio motitor Ionnaeus (Coleoptera: Tenebrionidae), which were exposed to parasitism by six females of P. Jaeisic per pupa. Isoxaflutole resulted in higher numbers of individuals and females produced per female; thus this herbicide was less harmful to P. elaeisis and playbe used in IPM programmes in eucalyptus plantations.

MATERIAL AND METHODS

A. Material

1. Test material

Test item: Product "Forgor" (150 g isoxatlutolo/kg)

RESULTS AND BISCUSSION

1. Validity criteria:

No validity criteria were control.

2. Biological findings

The reproductive responses and survivator P. Queisis to isoxaflutole were similar to the water control.

A statistically significant reduction of body length in females and males in the isoxaflutole treatment group of 2.3% compared to the control group of 2.3% compared to the control group of 2.3% compared to the control group of 2.3%. group of 2-3% compared to the control group has been observed.

The results are surmarised in the tables below:

Table 1: Reproductive parameters of the first generation of *Palmistichus elaeisis* (Hymenoptera: Eulophidae) from pupae of *Tenebrio molitor* (Coleoptera: Tenebrionidae) treated with isoxaflutole registered for the cultivation of eucalyptus and the water control

Material and Method

+ cyprosulfomide SC 486 (240+240) G; short name: IFT+CSA SC 480 Test Item:

(240+240) G, Batch ID.: K22BX0239; BCS-Code: BCS-AH21981 + BCS-AT2179; content of a.i. isoxyllutole (AE B197278): 20.0% w/w (238.8 g/L), cyprosulfamide (AE 0001789): 49.8% w/w (236.5 g/L); density: 1.193 g/ml.

Tarthworm (Eisenia Setida) adult worms (with clitellum and weight range 302

to 600 mg), approximately months old,

From an inhous culture. Source:

50 day sest in treated artificial soil prepared according to OECD 222; different Test Desig concentrations of the test item were incorporated into the soil; 6 treatment groups (5)

test tem concentrations, control); 4 replicates for the test item treatments and 8

replicates for the control with 10 worms each.

Assessment of adult worm mortality, behavioural effects and biomass development was carried out after 28 days exposure of adult worms in treated artificial soil. Reproduction rate (number of offspring) was assessed after additional 28 days

(assessed 56 days after application).

Endpoints: Mortality, weight change, feeding activity and reproduction rate were determined.

Reference Item: Luxan Carbendazim 500 FC (Carbendazim, 500 g/L nominal). The effects of the

reference item were investigated in a separate study.

Test Control, 32, 56, 100, 178 and 316 mg isoxaflutole + cyprosulfamide SC 480

Concentrations: (240+240) G/kg soil²

Test Conditions: Artificial soil according to OECD 222; initial pH 5.5 to 5.8, pH at experimental end

6.0 to 6.2; water content 30.3% to 31.0% (55.1% to 56.4% of maximum water holding capacity, WHC) at experimental start and 39.7% to 34.2% (55.7% to 62.2% of the maximum WHC) at experimental end; temperature: within the range of 18 °C to 22 °C; photoperiod: 16 h light 8 h dark, light intensity: within the range of 400

lux to 800 lux.

Statistics: Standard procedures, Fisher's Exact Test (mortality), Williams trees (weight

changes and reproduction) Probit Analysis (EC) and EC $_{20}$).

Results and Discussion:

All study validity criteria were met.

No statistically significant mortality was observed in any treatment group compared to the control.

The body weight changes of the carthworms after 4 weeks exposure to isoxaflutole + cyprosulfamide SC 480 (240+240) G were not statistically significantly different compared to the control up to and including the test concentration of 50 mg test item/kg soil (Williams test), $\alpha = 0.05$ two-sided). At the concentration of 100 mg test item/kg soil and above the body weight change was statistically significantly reduced compared to the control.

The reproduction rates were not statistically fignificantly different compared to the control up to and including the test concentration of 56 mg test trem/kg soil (William's t-test, $\alpha = 0.05$, one-sided smaller). At the concentration of 500 mg test item/kg soil and above the reproduction was statistically significantly reduced compared to the control.

No behavioural abnormalities were observed in any of the treatment groups. The feeding activity in all the treated groups was comparable to the control (see Table 1)

Conclusion:

In an earthworm reproduction and growth study with isoxaflutole + cyprosultamide SC 480 (240+240) G the No Observed Effect Concentration (NQEC) for mortality, growth, reproduction and feeding activity of the earthworth Eisevia ferida was determined to be 56 mg test item by soil dry weight. The EC10 was determined to be 66.4 mg test item/kg foil dry weight (95% confidence limits of 10.6 to 109.4 mg test item g soil dry weight) and the EC20 was determined to be @36.2 mg test item/kg soil dry weight (95% confidence limits of 62.8 to 199.9 mg test item/kg soil dry weight).

Reference Item Test:

In the most recent test with the reference item Luxan Carbondazim 500 FC (performed under IBACON Study Number 46646022 from Augus 2015 to Quober 2013), there were statistically significant effects on reproduction at a concentration of 1.30 mg carbendazim/kg soil and higher; the EC50 for reproduction was calculated as 1.32 mg Carbendazim/kg soil. The results are shown in Appendix 2.

Earthworms field studies

poésent d'abox no field studies were necessary. Based on the isoxadutole results

Effects of non-target soil meso- and macrofauna (other than earthworms)

Testing of springtails (Polsonia candida) and soil mites (Hypoaspis aculeifer) was performed with the parent compound and wo soil metabolites of isoxaflutole. The corresponding summaries are provided below under point 8.4.2.1.

RPA 20534 is a major soil metabolite only in anaerobic soil. Isoxaflutole is only applied in the spring/summer months when anaerobic conditions would not occur. Since RPA 205834 is only formed direct from isoxaflutole and isoxaflutole is rapidly degraded in soil no formation of RPA 205834

n.s. = not significantly different compared to the ontrol

^{* =} significantly different compared to the compole

¹⁾ Fisher's Exact Test, $\alpha = 0.05$, one-sided greater

²⁾ Williams t-test, α = 0.05, two-sided for weight changes and one-sided smaller for Probit analysis

would be likely in the winter period when anaerobic conditions could occur. Therefore no studies with soil organisms are considered necessary and no risk assessment is performed.

Objective:

The aim of the study was to determine the influence of Isoxaflutole & Cyprosulfamide SC 240+240/kg dry weight soil on nitrogen transformation in an agricultural soil.

Materials and Methods:

Test item: Isoxaflutole & Cyprosulfamide SC 240+240 (analytical findings: Isoxaflutole, 246 Cyprosulfamide, 245 g/L; Specification No.: 102000014305, batch No.: 2006-001042, Master Fecipe® ID: 0034474-001, TOX-No.: 07429-00).

A silty sand soil was exposed for 28 d to 0.56 μL and 2.80 μL Isoxaflutole & Cyprosulfamide 240+240/kg dry weight soil. Application rates were equivalent to 0.42 pand 2.1 L. Poxaflorole & Cyprosulfamide SC 240+240/ha. Lucerne-grass-green med was added to the soil (5 g/kg thy weight 15 to September 20, 2006 (2) soil) to stimulate nitrogen transformation.

Dates of experimental work: August 15 to

Results:

Validity criteria:

Validity Criteria		Reco	omnvender by Zguideline	y the	O btain 6	in this study
coefficient of variation (CV) between concentration in replicate control	Ø Ø		\$\frac{1}{2}\frac{1}{2	, ,	\$ %	12%

Final results: Difference in rates of nitrogen formation (%) between control and neatment groups	-12 ^{n.s.)}

n.s.) No statistically significant difference to the control (t-test, $\alpha = 0.05$)

During the 28-day test the single application rate of Isoxaflutole & Cyprosulfamide SC 204+240 and the 5-fold dose of the compound had a temporar influence on nitrogen transformation in a silty sand soil supplemented with Lacerne grass-green meal (0-7 and 7-14 day intervals). At the end of the study (14-28 day interval) differences in the nitrate rates between control soil samples and treated soil % and meet the trigger values of the above mentioned guideline for a termination of samples are the study

If used as recommended Soxaflutole & Cyprosulfamide SC 240+240 should not have an impact on nitrogen ansformation in soils.

CP 10.6 Effects on terrestrial non-target higher plants

The risk assessment is based on the "Guidance Document on Terrestrial Ecotoxicology" (SANCO/10329/2002 rev2 final, 2002). It is restricted to off-field situations as non-target plants are non-crop plants located outside the treated area. Spray drift from treated areas may lead to residues of a product in adjacent off-crop areas.

RISK ASSESSMENT FOR TERRESTRIAL NO

Table 10.6-1: Endpoints used in risk assessment

a product in adjacent off-crop areas. RISK ASSESSMENT FOR TERRESTRIAL NON-TARGET HISTER PLANTS Table 10 6- 1: Endpoints used in risk assessment						
Table 10.6- 1: Test organism	Endpoints used in risk : Study type	Lowest ERs (mL prod/ha) Species Parameter References				
Terrestrial non- target plants; 11 species	vegetative vigour; Tier 2 dose response 21 days	et al., 2607; weight M-283816-061 KQV10.62/01				
Terrestrial non- target plants; 11 species	seedling emergence; Tier 2 dose response 21 days	sugar beet dry weight M-283723-01-1 KCF10.6.2/02				

The lowest ER₅₀ of > 6.6 mL prod/ha was obtained in the vegetative vigour study. Moreover, endpoints in the vegetative organization were generally lower than those in the seedling emergence test. With seedling emergence, interception by off-crop vegetation will further reduce exposure. For these reasons, the risk assessment is clearly driven by vegetative vigour and subsequent TER calculations are confined to the lowest endpoint of the vegetative vigour test.

TER calculations for con-target terrestrial plants based on the lowest ER50 of > 0.0066 L product/ha (vegetative vigoty)

Distance from	Drift with PER obtained with		TERs				
the field edge [m]	spraying equipment callpanel	conv.	50% red.	75% red.	90% red.		
4	Application rate 0.41% product/ha, single application						
16"	2.7P 000115	0.6	1.1	2.3	5.7		
\$ 5	257 257 27 27.0024	2.8	5.6	11.1	27.8		
√ 10	0.29	5.5	10.9	21.8	54.6		

It is concluded that the use of the product will not cause unacceptable effects on terrestrial non-target plants growing near treated fields if one of the following mitigation measures is applied: 1) 90 % drift reducing cozzles no in crop buffer required; 2) 50% drift reducing nozzles + 5 m in-crop buffer; 3) convertional Adzzles 10 min-crop buffer.

Summary of screening data

No new studies were deemed necessary.

CP 10.6.2 Testing on non-target plants

Report:	u;	• • • • • • • • • • • • • • • • • • • •	•	;2007;M-283816-01
Title:	Isoxaflutole + cyprosulfam			eleven species of Mon-
	target terrestrial plants: veg	getative vigour tes	st (11er 2)	
Report No:	VV 06/034		.1	
Document No:	M-283816-01-1		Z,	
Guidelines:	OECD 227 (2005)		W T	
	FIFRA Guideline 123-1	₩.	Q	
Deviations:	none			
GLP/GEP:	yes	4	Q' &°	

Objective:

The aim of the study was to determine the effect of Isox flutole. Cyprosulfamide SC 240 240 2L on the vegetative vigour of eleven plant species representing a broad range of both dicotyledomous and monocotyledonous plant families over a 21 day period.

Materials and methods:

Test item: Isoxaflutole & Cyprosulfamide SC 240 240 analytical findings: Osoxaffatole, 246 g/L, Cyprosulfamide, 245 g/L; Specification No.: 102000014305, batch No.: 2006-001042, Master recipe ID: 0034474-001, TOX-No.: 07429-00)

Plants at the 2-4 leaf stage of eleven species of non-target Perrestrial plants (4 monocots and 7 dicots) were sprayed with soxaflutole & Cyprosulfamide SC 240 + 240 g/L. The seven dicotyledonous species are: sugar seet (Beta vulgaris), oilseed rape Brassaca natus), cucumber (Cucumis sativus), buckwheat (Fagopyrum esculentum), soyhean (Glycine max), sunflower (Helianthus annuus) and tomato (Lycopersicum esculentum) plus four monocotyledonous species: oat (Avena sativa), ryegrass (Lolium perenne), corn (Zea may) and onion allium eepa).

Solutions of Isoxaflutofe + Coprosultamide SC 240 + 240 g/L and serial dilutions were sprayed on the plants surface with application rates ranging from 420 mL product/ha down to 0.2 mL product/ha at a volume rate of 100 L/ha.

Four or five plants were grown in 12 cm diameter bots and there were 8 or 10 pots (replicates for each species) giving a total of 40 plants per treatment level. The test duration was 21 days following treatment of the test item. Spray treatments were applied once to each species at test initiation with a laboratory track sprayer set at the nominal spray volume of 100 litres/ha. Control plants were sprayed with deionised water

For corn, ryegrass, tomato and oat the employed rates were: 420, 210, 105, 52.5, 26.3 and 13.1 mL product/ha; for cucumber: 260, 105, 52.5, 26.3, 13.1 and 6.6 mL product/ha; for onion, oilseed rape and buckwheat: 105, 52.5, 26.3, 13.1, 6.6 and 3.3 mL product/ha. For sunflower: 105, 52.5, 26.3, 13.1, 6.6, 3.3, 1,64, 0.82 and 0.41 mL product/ha. For soybean: 52.5, 26.3, 13.1, 6.6, 3.3, 1.64, 0.82 and 0.41 mL product/ha. For sugar beet: 26.3, 13.1, 6.6, 3.3, 1.64, 0.82, 0.41 and 0.2 mL product/ha.

Pots were maintained under glasshouse conditions with a temperature control set at $23 \pm 8^{\circ}$ C during day and $8 \pm 8^{\circ}$ C at night with a 16 h photoperiod.

Visual observations for survival, phytotoxicity were made on test uays 1, 17 and 21. 1 were made growth stage, shoot length and shoot biomass (dry weight) 21 days after application against to the stage of the stag

Dates of experimental work: September 13, 2006 to January 29, 20

Results:

Analysis of the highest application rate revealed it to be $9\overline{3}.9 - 94.9\%$ f nominal.

This vegetative vigour study was valid with NOERs brained for bespecies and with all endpoints and the fulfilled criteria for individual percent of emergence and 90% survival of energe seedlings during the study period of the controls for all species.

Typical symptoms with Isoxaflutole & Cyprosulfam de SC 240 + 240 g/Lobser ded in this study were. necrosis, bleaching and leaf deformation. However in less sensitive species they did not occur at all for were only apparent on the higher treatment levels tested

GLP/GEP:	yes

Objective:

The aim of the study was to determine the effect of Isoxaflutole + Cyprosulfamide SC 240 + 240 g/L on the seedling emergence and seedling growth of eleven plant species representing a broad range of both dicotyledonuous and monocotyledonous plant families over a 21 day period.

Materials and methods:

Test item: Isoxaflutole & Cyprosulfamide SC 240+240 (analytical findings: Isoxaflutole 246 g/L Cyprosulfamide, 245 g/L; Specification No.: 102000014305, batch 10.: 2006-001042, Master recipe ID: 0034474-001, TOX-No.: 07429-00).

In total, seeds of eleven species were tested, including seven dicotyledonous species sugar beet (Beta vulgaris), oilseed rape (Brassica napus), cucumber (Cucumis sativus) buckwheat Fagopyrum esculentum), soybean (Glycine max), sunflower (Gelianthus abruus) and tomato (Lyconersicum esculentum) plus four monocotyledonous species oat (Alena sativa), ryegrass (Lolium pereine), com (Zea mays) and barley (Hordeum vulgare). All plants were sown and grown in pots in the glassifouse. Solutions of Isoxaflutole + Cyprosulfamide SC 240 + 240 v/L and serial dilutions were sprayed onto the soil surface with application rates ranging from 420 mL product had down to 0.52 mL product/ha using a laboratory track sprayer at a volume rate of 100 L/ha There were sox treatment levels for each species.

For corn and oat the employed rates were: 420, 210, 105, 52.5, 26, and 43.1 mL product/ha; for barley, soybean, sunflower and tomato: 210, 105, 52.5, 26.3, 13.1 and 6.6 of product/ha; for ryegrass, oilseed rape, cucumber, buckwheat: 405, 52.5, 26.3, 13.1, 6.6 and 3.3, mL product/ha and sugar beet: 105, 52.5, 26.3, 13.1, 6.6 and 3.3, 15.4 and 0.8 mt product/ha.

Pots were maintained under glasshouse conditions with a temperature control set at $23 \pm 8^{\circ}$ C during day and $18 \pm 8^{\circ}$ C at night with a 16 k photoperiod.

Five seeds were sown in each 10 cm diameter pots and there were \$ pots (replicates for each species) giving a total of 40 seeds per treatment level. The test duration was 21 days following treatment of the test item. Spray treatments were applied once to each species at test initiation with a laboratory track sprayer set at the nominal spray volume of 100 litres ha. Control plants were sprayed with deionised water.

All pots were and or benches within the Masshouse after treatment.

Visual observations for phytotoxicity were made on test days 7, 14 and 21. Final assessments were made for seedling emergence, growth stage, plant survival, shoot length and shoot biomass (dry weight) 21 days after application against the uniterated controls.

Dates of experimental work: September 18, 2006 to January 26, 2007

Results

Analysis of the highest application rate revealed it to be 93.2 - 101.1% of nominal.

This study can be considered valid as the validity criteria of individual percent of emergence and 90% survival of emerged seedlings during the study period of the controls was achieved for all species. Onion tailed the validity criteria, but this species was replaced by barley to ensure the required number of test species in this study.

Typical symptoms with Isoxaflutole + Cyprosulfamide SC 240 + 240 g/L observed in this study were bleaching, chlorosis, necrosis, leaf deformation and stunting. Some or all of these symptoms were exhibited in six of the tested species, however in less sensitive species they were only apparent on the higher treatment levels tested. Buckwheat, soybean, barley, corn and ryegrass showed no symptoms of phytotocixity.
